The natural logarithm  $\ln x$  is the logarithm having base  $e$ , where  $e=2.718281828\dots$  (1) This function can be defined  $\ln x = \int_1^x (dt)/t$  (2) for  $x > 0$ . This definition means that  $e$  is the unique number with the property that the area of the region bounded by the hyperbola  $y=1/x$ , the  $x$ -axis, and the vertical lines  $x=1$  and  $x=e$  is 1. In other words ...

Box and Cox (1964) developed the transformation. Estimation of any Box-Cox parameters is by maximum likelihood. Box and Cox (1964) offered an example in which the data had the form of survival times but the underlying biological structure was of hazard rates, and the transformation identified this.
